

The dMatern model

Parametrisation

This model is the Gaussian field with a Matérn correlation function, directly, meaning **dense matrices**. This model is intended for a low-dimension only. The correlation function is

$$\text{Corr}(d) = \frac{1}{2^{\nu-1}\Gamma(\nu)} (\kappa d)^\nu K_\nu(\kappa d), \quad \alpha = \nu + d/2,$$

where K_ν is the modified Bessel function and $\Gamma(\cdot)$ is the Gamma-function. The range is *defined* to be

$$r = \sqrt{8\nu}/\kappa$$

which about the distance where the covariance function becomes about 0.1.

Hyperparameters

The hyperparameters are the precision parameter τ , the range r and the smoothness ν , where the internal representation are

$$\theta = (\log(\tau), \log(r), \log(\nu))$$

The latent field has marginal variance $1/\tau$ and range (as defined above) r .

We do **not recommend** to treat ν as random, and for this reason it is default fixed. You can change its value by changing the initial value.

Specification

The `dmatern` model is specified inside the `f()` function as:

```
f(idx, model="dmatern", locations = L, hyper = <hyper>)
```

where L is a matrix of the locations for which the Gaussian field is defined; row $L[i,]$ are the coordinates for the i 'th location. `idx` represent the location indexing the corresponding row in L , so $idx = 3$ means location $L[idx,]$. `idx` must be integers 1, 2, ..., `nrow(L)`, or `NA`.

Example

```

library(INLA)
library(mvtnorm)

# 1D example. locations are 1, 2, ..., 'n', with 'nr' replications
range = 10
n = 50
nr = 20
loc = 1:n
var = 1.0
nu = 0.5

S = matrix(0, n, n)
for(i in 1:n) {
  for(j in i:n) {
    d = sqrt((loc[i] - loc[j])^2)

```

```

        S[i, j] = var * INLA:::inla.matern.cf(d, range = range, nu = nu);
        S[j, i] = S[i, j]
    }
}
y = c(t(rmvnorm(nr, sigma = S)))
r1 = inla(y ~ -1 + f(idx, model="dmatern", locations = loc, replicate = re,
        ## placing the prior at the correct value, just for
        ## demonstration
        hyper = list(range = list(initial = log(range), param = c(range, 0.5)))),
        data = data.frame(y, idx = rep(1:n, nr), re = rep(1:nr, each = n)),
        family = "gaussian",
        ## just this this at some high value
        control.family = list(hyper = list(prec = list(initial = 12, fixed=TRUE))))

if (FALSE)
    plot(r1, plot.random.effect = FALSE)

# 2D example. Simulate 'n' data in a [0, 1]^2 box, with 'nr' replications
range = 0.2
n = 50
nr = 20
loc = matrix(runif(2*n), ncol = 2, nrow = n)
var = 1.0
nu = 0.5

S = matrix(0, n, n)
for(i in 1:n) {
    for(j in i:n) {
        dif = loc[i, ] - loc[j, ]
        d = sqrt(sum(dif^2))
        S[i, j] = var * INLA:::inla.matern.cf(d, range = range, nu = nu);
        S[j, i] = S[i, j]
    }
}
y = c(t(rmvnorm(nr, sigma = S)))
r2 = inla(y ~ -1 + f(idx, model="dmatern", locations = loc, replicate = re,
        ## placing the prior at the correct value, just for
        ## demonstration
        hyper = list(range = list(initial = log(range), param = c(range, 0.5)))),
        data = data.frame(y, idx = rep(1:n, nr), re = rep(1:nr, each = n)),
        family = "gaussian",
        ## just this this at some high value
        control.family = list(hyper = list(prec = list(initial = 12, fixed=TRUE))))

if (FALSE)
    plot(r2, plot.random.effect = FALSE)

```

Notes

Note that the above definition of range, might differ from the definition in other packages. It is the same used for the SPDE-models.
