

PC prior for precision

Parametrization

The PC prior for precision has density

$$\pi(x) = \frac{\theta}{2} \exp \left(-\theta \exp \left(-\frac{x}{2} \right) - \frac{x}{2} \right) \quad (1)$$

for $x > 0$ where

$$\theta = -\frac{\ln(\alpha)}{u}$$

and (u, α) are the parameters to this prior. The interpretation of (u, α) is that

$$\text{Prob}(\sigma > u) = \alpha$$

where $\sigma = 1/\sqrt{\exp(x)}$, as x is the log-precision.

Specification

This prior for the hyperparameters is specified inside the `hyper`-specification, as

```
hyper = list(<theta> = list(prior="pc.prec", param=c(<u>,<alpha>)))
```
