

LogLogistic

Parametrisation

The LogLogistic distribution has cumulative distribution function

$$F(y) = \frac{1}{1 + (y/\beta)^{-\alpha}}$$

where

$\alpha > 0$ is the shape parameter.

$\beta > 0$ is the scale parameter.

Link-function

The parameter β is linked to the linear predictor as:

$$\beta = \exp(\eta)$$

Hyperparameters

The α parameter is represented as

$$\theta = \log \alpha$$

and the prior is defined on θ .

Specification

- family = loglogistic
- Required arguments: y (to be given in a format by using `inla.surv()` function)

Hyperparameter spesification and default values

hyper

theta

name log alpha
short.name alpha
initial 1
fixed FALSE
prior loggamma
param 25 25
to.theta
from.theta

survival TRUE

discrete FALSE

link default log

pdf loglogistic

Example

In the following example we estimate the parameters in a simulated case

```
rloglogistic = function(n, beta, alpha = 1)
{
  p = runif(n)
  return (beta* (((1-p)/p)^(-1/alpha)))
}

n = 1000
alpha = 2
x = runif(n)
eta = 1+x
beta = exp(eta)
y = rloglogistic(n, beta = beta, alpha = alpha)
event = rep(1,n)
data = list(y=y, event=event, x=x)
formula=inla.surv(y,event) ~ x
r=inla(formula, family ="loglogistic", data=data, verbose=T)
```

Notes

- Loglogistic model can be used for right censored, left censored, interval censored data.
- A general frame work to represent time is given by `inla.surv`
- If the observed times y are large/huge, then this can cause numerical overflow in the likelihood routines giving error messages like

```
file: smtp-taucs.c  hgid: 891deb69ae0c  date: Tue Nov 09 22:34:28 2010 +0100
Function: GMRFLib_build_sparse_matrix_TAUCS(), Line: 611, Thread: 0
Variable evaluates to NAN/INF. This does not make sense. Abort...
```

If you encounter this problem, try to scale the observatios, `time = time / max(time)` or similar, before running `inla()`.
