Simplex

Parametrisation

The Simplex distribution has the following density

$$\pi(y) = \frac{\sqrt{(s\tau)}}{\sqrt{2\pi[y(1-y)]^3}} \exp\left\{\frac{-(s\tau)(y-\mu)^2}{2y(1-y)\mu^2(1-\mu)^2}\right\}$$

has has a continuously responses 0 < y < 1 where

 μ : is the mean,

 τ : is a precision parameter, and

s: is a fixed scaling, s > 0.

For the simplex distribution we have

$$E(y) = \mu$$

Link-function

The linear predictor η is linked to the mean μ using a default logit-link,

$$\mu = \frac{\exp\left(\eta\right)}{1 + \exp\left(\eta\right)}.$$

Hyperparameter

The hyperparameter is the precision parameter τ , which is represented as

$$\tau = \exp(\theta)$$

and the prior is defined on θ .

Specification

- family = simplex
- Required arguments: y.

Hyperparameter spesification and default values

hyper

theta

hyperid 64001
name log precision
short.name prec
initial 4
fixed FALSE
prior loggamma
param 1 5e-05
to.theta function(x) log(x)
from.theta function(x) exp(x)

survival FALSE

discrete FALSE

Example

In the following example we estimate the parameters in a simulated example.

Notes

None.
