Sigmoidal effect of a covariate

Parametrization

This model implements a non-linear effect of a positive covariate x as a part of the linear predictor. It comes in two variants, sigmoidal

$$\beta \frac{x^k}{x^k + a^k}$$

where $x \geq 0$, k > 0 and a > 0, and the reverse-sigmoidal

$$\beta \frac{a^k}{x^k + a^k}.$$

Here, a is the halflife parameter, k the shape-parameter and β the scaling.

Hyperparameters

This model has three hyperparameters, the scaling β , halflife a and shape k,

$$\theta_1 = \beta$$
 $\theta_2 = \log(a)$ $\theta_3 = \log(k)$

and the priors are given for θ_1, θ_2 and θ_3 .

Specification

```
f(x, model="sigm", hyper = ..., precision = <precision>)
f(x, model="revsigm", hyper = ..., precision = <precision>)
```

where precision is the precision for the tiny noise used to implement this as a latent model.

Hyperparameter specification and default values

hyper

```
theta1
    hyperid 38001
    name beta
    short.name b
    initial 1
    fixed FALSE
    prior normal
    param 1 10
    to.theta function(x) x
    from.theta function(x) x
theta2
    hyperid 38002
    name loghalflife
    short.name halflife
    initial 3
    fixed FALSE
```

prior loggamma

```
param 3 1
         to.theta function(x) log(x)
         from.theta function(x) exp(x)
     theta3
         hyperid 38003
         name logshape
         short.name shape
         initial 0
         fixed FALSE
         prior loggamma
         param 10 10
         to.theta function(x) log(x)
         from.theta function(x) exp(x)

Example
sigm = function(x, halflife, shape = 1)
    xx = (x/halflife)^shape
    return (xx/(1.0+xx))
revsigm = function(x, halflife, shape = 1)
    xx = (x/halflife)^shape
    return (1.0/(1.0+xx))
}
n = 1000
lambda = 10
s=0.01
x = rpois(n, lambda = lambda)
halflife = lambda
shape = 2
```

```
y = sigm(x, halflife, shape) + rnorm(n, sd = s)
r = inla(y ~-1 + f(x, model="sigm"),
        data = data.frame(y, x),
        family = "gaussian",
        control.family = list(
                hyper = list(
                        prec = list(
                                initial = log(1/s^2),
                                fixed = TRUE))))
summary(r)
y = revsigm(x, halflife, shape) + rnorm(n, sd = s)
r = inla(y -1 + f(x, model="revsigm"),
        data = data.frame(y, x),
        family = "gaussian",
        control.family = list(
                hyper = list(
                        prec = list(
                                initial = log(1/s^2),
                                fixed = TRUE))))
summary(r)
```
