# Random walk model of order 2 (RW2)

#### Parametrization

The random walk model of order 2 (RW2) for the Gaussian vector  $\mathbf{x} = (x_1, \dots, x_n)$  is constructed assuming independent second-orderincrements:

$$\Delta^2 x_i = x_i - 2 \ x_{i+1} + x_{i+2} \sim \mathcal{N}(0, \tau^{-1})$$

The density for **x** is derived from its n-2 second-order increments as

$$\pi(\mathbf{x}|\tau) \propto \tau^{(n-2)/2} \exp\left\{-\frac{\tau}{2} \sum_{i} (\Delta^2 x_i)^2\right\}$$
 (1)

$$= \tau^{(n-2)/2} \exp\left\{-\frac{1}{2}\mathbf{x}^T \mathbf{Q} \mathbf{x}\right\}$$
 (2)

where  $\mathbf{Q} = \tau \mathbf{R}$  and  $\mathbf{R}$  is the structure matrix reflecting the neighbourhood structure of the model. It is also possible to define a *cyclic* version of the RW2 model.

### Hyperparameters

The precision parameter  $\tau$  is represented as

$$\theta = \log \tau$$

and the prior is defined on  $\theta$ .

### **Specification**

The RW2 model is specified inside the f() function as

```
f(<whatever>,model="rw2",values=<values>,cyclic=<TRUE,FALSE>,
```

The (optional) argument values is a numeric or factor vector giving the values assumed by the covariate for which we want the effect to be estimated. See the example for RW1 for an application.

#### Hyperparameter spesification and default values

#### hyper

theta

name log precision
short.name prec
prior loggamma
param 1 5e-05
initial 4
fixed FALSE
to.theta function(x) log(x)
from.theta function(x) exp(x)

constr TRUE

nrow.ncol FALSE

augmented FALSE

```
aug.factor 1
aug.constr
n.div.by
n.required FALSE
set.default.values FALSE
pdf rw2

Example

n=100
z=seq(0,6,length.out=n)
y=sin(z)+rnorm(n,mean=0,sd=0.5)
data=data.frame(y=y,z=z)

formula=y~f(z,model="rw2")
result=inla(formula,data=data,family="gaussian")
```

## Notes

The RW2 is a intrinsic with rank deficiency 2.

There model also supports irregular locations or values.
